

## **Practical insights in setting up a project controls framework within a young organisation established to deliver a mega project – Westconnex**

As a young organisation, Sydney Motorway Corporation (SMC) is on a continuous journey to develop a project controls framework for the development and delivery of \$16.8 billion in capital spending.

There is an overwhelming amount of information readily available to today's project management and control professionals -- cost management and control, scheduling, earned value, WBS, risk management, change management and KPIs. However, trying to implement all practices without a framework to choreograph and integrate project execution and management processes is a challenge.

Using Westconnex as a case study, the presentation will explore the current state of project controls within SMC. It will cover project controls that are going well and areas that need improvement, and provide practical insights into setting up project controls in a new organisation.
